

Press release InnoTrans 2016; 15.07.16 Senftenberg (Germany)

zedas[®] cargo mobilises rail logistics

ZEDAS GmbH is demonstrating at InnoTrans 2016, how the potential offered by the digital world can be availed of by rail logistics.

The use of mobile solutions for smartphones and tablets offers added value for business processes within rail logistics. The applications make it possible for locomotive drivers, wagon technicians and inspectors at any location to access selected information and to then use this information for the tasks that their jobs involve. The use of these applications reduces the number of complex consultation meetings required, as well as the keeping of records and automatically delivers exact data for the invoicing of services provided. ZEDAS GmbH – a pioneer of mobile applications for rail logistics – supports making use of the chances offered by new technologies. zedas[®] cargo is an integrated browser-based solution for rail freight transport, that can be used on all established device platforms (Apple iOS, Google Android, Microsoft Windows). Using the software is intuitive and automatically adjusts to the respective type of device. The integrated offline functionality makes autarkic working possible without a permanent data connection being required.

Typical applications:

- » Employee information (e.g. work schedule)
- » Documentation of actual times and particularities
- » Processing of freight and vehicle data
- » Preparing and checking trains
- » Documentation of damaged carriages including recording facts of the incident
- » Documentation of switching moves
- » Recording of specific operating data

It is in this way that the software slims down and optimises the logistics processes and accelerates the company's digitalisation. At the InnoTrans 2016 in Berlin, the further developments will be presented: ZEDAS GmbH will present itself at the City Cube, stand B/201.
